

# Simple Shell

**Name : Ahmed Mohamed Kamal EL-Bawab**  
**ID: 09**

## 1- Description:

The overall process is very simple using a while loop which starts first by parsing the command to vector of strings then to vector of char \* and while that & is popped out then make a fork and check if child execute the command and if parent the & is checked to check if wait is needed after that a new command is taken and so on , signal handler is done through a method which writes in a file in a given path.
